

Storm In A Jar

Rain falls from clouds when it becomes too heavy to float in the air.

You can build a pretend rainstorm in a jar using a clear container, water, shaving cream, and food coloring.

Begin by filling your container with water.

This will stand in for the air.

Add a tiny bit of shaving cream cloud to the top of the water, just enough to cover the water. Don't mix it in, just let it sit on top.

Carefully, add food coloring into the cloud.

Then watch the side of the container.

In a few seconds, you should see colorful "rain" begin to fall from the cloud.
